## QUICK GUIDE on how to use a JPG overlay file in Photoshop?

The steps described below can be used to apply any JPG overlay with a black background using any image editing software supporting blend modes. The black background will be made transparent by using the blend mode "Screen".

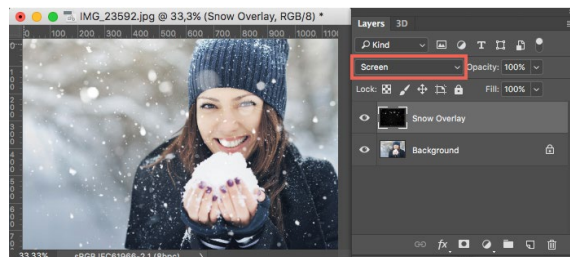

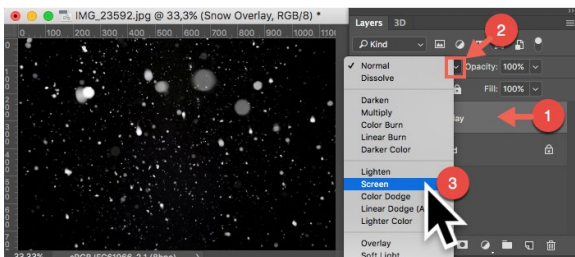

1. **Open** a snow overlay JPG file and your destination photo or design.
2. **Drag & drop** or copy & paste the snow overlay on your destination document.

3. **Resize** the snow overlay until it covers your destination document.

4. Make sure the snow overlay layer is selected (1) and set the snow overlay layer's blend mode to "Screen" (2) & (3).

And you're done. Use a mask or the stamp tool on the snow overlay layer to remove distracting snow. Lower the snow overlay layer's opacity value to reduce the effect.
